

MEP 2G

HEARING PROTECTORS WITH FLAT ATTENUATION

The MEP-2G (second generation) is the latest generation in hearing protection with flat attenuation (noise reduction). Musicians, music lovers and concertgoers will be able to experience sound just like before, but at a reduced level, thanks to the upgraded and unique design and in combination with filters that offer flat attenuation. The flat attenuation ensures that sound quality is maintained. The new filters are integrated in a modular unit and this makes them very easy to exchange while also providing maximum comfort for the user.

Facts

Musicians practice and perform under various conditions which exposes them to high noise levels, sometimes for prolonged periods. Concertgoers regularly experience excessive volume. Depending on the noise levels, there is a choice of 3 different filter values, namely 15, 19 and 22 dB attenuation. One pair of filters of the user's choice is supplied with the purchase. The MEP-2G essentially dampens all frequencies equally. This ensures

that music and voices are heard equally clearly and remain natural sounding.

Users are also able to replace their filters to suit each and every situation. The choice of a noise reduction filter depends on the length and intensity of exposure to noise.

Reality

Thanks to ongoing product improvements and developments, the MEP-2G is a customized product that is user-friendly and versatile in its application. Impressions of the ear are required to manufacture this product. Contact us or your distributor for guidance on this aspect. The product is supplied with standard accessories such as cleaning materials, a storage pouch and instruction manual. Ask your distributor for more added value such as checking for leaktightness and accessories.

This product is available in a variety of colours. Visit www.variphone.com to see the available options.

Approval: DIN EN352-2: 2003

NOISE REDUCTION (dB)
